Todd and all:

Below, please find the "correct link" to the CTEH data on water quality.

Then, in the posting at the bottom of the page, "copy and paste" the user name and password into the appropriate boxes to to get access. For some reason, when I typed them it they weren't taken, but on advice to copy and paste, it worked.

SW10 and SW13 is the water sample taken outside of the COE pump house and the head of the marsh to pump channel respectively.

Based on the following, ND DoH recommends that the COE immediately restart the pumps at the Williston COE Station:

- 1) The impacted parts of the Little Muddy Relief Channel have been doubly isolated from the pump house intakes, by sealing the upstream side of the culvert under the COE Office access road, and at that point where the Little Muddy Relief Channel narrows south of the railroad.
- 2) Two large capacity pumps are continuously pumping water from the Little Muddy Relief Channel to the Little Muddy River, north of Broadway Ave to increase storage in that stretch of the channel in the event of storm conditions.
- 3) Analysis of the water, on July 25 (Friday), on the upstream side of the COE office culvert plug, shows fairly normal, concentrations of major ions, and concentrations of diesel range organic compounds and motor oil range organic compounds of 0.140 and 0.180 mg/L respectively.
- 4) The isolation of the water between Broadway Ave and the COE offices will continue until acceptable conditions are reached and agreed on by all parties, barring nature taking direct participation.
- 5) Delaying restart of the pumps may cause stagnation of the water flowing from the Williston Marsh.

Kris Roberts
